From Structure to Dynamics

The Co-Production Challenge

Mike Batty, Modelling the World 2016

- “We need to do many things and the most important is working with decision-makers & people who will use these tools.”
- “the process of translating models into tools is one which is lengthy and involved – more involved than building these models per-se and we have only just begun to recognise this”

ITRC & STFC development of a £8 million *Data and Analytics Facility for National Infrastructure*

- A national infrastructure database based around NISMOD-DB++.
- HPC environment for computationally demanding Cities and Infrastructure systems analytics, modelling and visualisation.
